A Practical Introduction To Hardware

You can apply an inverse Fourier transform to the frequency domain vector, Y , to recover the time signal. The 'symmetric' flag tells ifft that you are dealing with a real-valued time signal so it will zero out the small imaginary components that appear on the inverse transform due to numerical inaccuracies in the computations. Notice that the original time signal, y , and the recovered signal ...

Practical Introduction to Frequency-Domain Analysis

The trill signal consists of a train of tonal pulses. Look at the time signal and the spectrogram obtained by `pspectrum` when no resolution is specified and when time resolution is set to 10 milliseconds. Set the 'Leakage' parameter to 1 to use rectangular windows. Since we want to localize the time position of the pulses, set overlap percent to 0.

Computer hardware is the set of physical parts that make up the interior of your computer. Peripherals are pieces of hardware that are added to the outside of a computer for it to work more efficiently. Both hardware and peripherals are used to take input, store data, display output, and execute commands.

The hardware is kept as simple and fast as possible. A given complex instruction can be performed by a sequence of much simpler instructions. For example, many processors have an xor (exclusive OR) instruction for bit manipulation, and they also have a clear instruction to set a given register to zero.
