Nose: Anatomy and Histology of the Human Nose | Medical ... The anatomy and histology of the human temporomandibular joint indicates that the meniscus is firmly attached to the mandibular condyle and that during translatory movements the meniscus and condyle move concomitantly. The lateral pterygoid muscle, both inferior and superior heads insert into the meniscus and the pterygoid fovea of the condyle. 2.

Anatomy and histology of the human temporomandibular joint Historically, spongy bone is comprised of anastomosing strips of slender bone known as trabeculae that enclose marrow and blood vessels. It forms the relatively softer core of the bones that is filled with marrow. The less densely arranged trabeculae also contribute to making the bones lighter (as opposed to the heavier compact bone).
