Answers To The Extra Mitosis

"Mitosis is that step in the cell cycle where the newly formed DNA is separated and two new cells are formed with the same number and kind of chromosomes as the parent nucleus." Mitosis is a process of asexual reproduction observed in unicellular organisms. Read on to explore what is mitosis, and the different stages of mitosis.

Mitosis was discovered by Walther Flemming, while meiosis was discovered by Oscar Hertwig. Cytokinesis occurs only in telophase during mitosis, while it occurs in Telophase 1 and telophase 2 during meiosis. The primary function of mitosis is general growth and repair. It is also used for cell reproduction. Tetrad formation is not observed in ...

Chromatids in Mitosis . When it is time for a cell to replicate, the cell cycle begins. Before the mitosis phase of the cycle, the cell undergoes a period of growth called interphase where it replicates its DNA and organelles to prepare for division. The stages that follow interphase are listed chronologically below.

During mitosis, the 23 pairs of human chromosomes condense and are visible with a light microscope. A karyotype analysis usually involves blocking cells in mitosis and staining the condensed chromosomes with Giemsa dye. The dye stains regions of chromosomes that are rich in the base pairs Adenine (A) and Thymine (T) producing a dark band.

prenatal development, also called antenatal development, in humans, the process encompassing the period from the formation of an embryo, through the development of a fetus, to birth (or parturition). The human body, like that of most animals, develops from a single cell produced by the union of a male and a female gamete (or sex cell). This union marks the beginning of the prenatal period ...
