Combustion Modelling Simulations Of Combustion

Comprehensive combustion modeling and simulation is an essential and integral part of modern design/optimization of low-emissions, high-performance combustors. An integrated system of computer codes, termed as the National Combustion Code (NCC), has been developed by an industry-government team for this purpose [2].

Combustion models for CFD refers to combustion models for computational fluid dynamics. Combustion is defined as a chemical reaction in which a hydrocarbon fuel reacts with an oxidant to form products, accompanied with the release of energy in the form of heat. Being the integral part of various engineering applications like: internal combustion engines, aircraft engines, rocket engines, furnaces, and power station combustors, combustion manifests itself as a wide domain during the design, analysis
