In infrared photography, the film or image sensor used is sensitive to infrared light. The part of the spectrum used is referred to as near-infrared to distinguish it from far-infrared, which is the domain of thermal imaging. Wavelengths used for photography range from about 700 nm to about 900 nm. Film is usually sensitive to visible light too, so an infrared-passing filter is used; this lets ...

The only analog film is the slide film. You develop it, and it's done. You can just look at it with your own eyes. And when I project it using a projector, it looks beautiful. But... the dynamic range of slide is much lower than that of digital. About 6 stops at most. Slide photographers know this very well.
