As has been discussed in Chapter One, mathematical programming (or optimization) is a powerful tool for process integration. For an overview of optimization and its application in pollution prevention, the reader is referred to El-Halwagi (1995). In this chapter, it will be shown how optimization techniques enable the designer to:

Mathematical Programming publishes original articles dealing with every aspect of mathematical optimization; that is, everything of direct or indirect use concerning the problem of optimizing a function of many variables, often subject to a set of constraints. This involves theoretical and computational issues as well as application studies.

A program converts the total number of minutes and seconds input by user into just seconds. For example, if the user put in 4 minutes and 12 seconds, the program would output 252 seconds. Which of the following equations would perform this calculation, given that the variable minutes holds the number of minutes and the variable seconds holds the number of seconds?
