discipline distinct from atomic physics starts with the discovery of radioactivity by Henri Becquerel in 1896, made while investigating phosphorescence in uranium salts. The discovery of the electron by J. J. Thomson a year later was an indication that the atom had internal structure. At the beginning of the 20th century the accepted model of

one of the most common thermodynamic cycles found in modern gas turbine engines. In this case, assume a helium gas turbine with a single compressor and single turbine arrangement. One of the key parameters of such engines is the maximum turbine inlet temperature and the compressor pressure ratio ( $PR = p_2 / p_1$ ), which

In physics, a force is an influence that can change the motion of an object. A force can cause an object with mass to change its velocity (e.g. moving from a state of rest), i.e., to accelerate. Force

can also be described intuitively as a push or a pull. A force has both magnitude and direction, making it a vector quantity. It is measured in the SI unit of newton (N).

reactors contain both fissile and fertile materials. For example, most PWRs use low enriched uranium fuel with enrichment of  $^{235}\text{U}$  up to 5%. Therefore more than 95% of the content of fresh fuel is fertile isotope  $^{238}\text{U}$ . In fact, during fuel burnup, the fertile materials (conversion of  $^{238}\text{U}$  to fissile  $^{239}\text{Pu}$  known as ...
