Calculating resistance, voltage, and current using Ohm's law

Electrical energy (kWh) = Power (kW) X time (h) $E = Pt$. $E P T$. Electrical Power (watts) = current (amps A) X voltage difference (volts) $P = IV$. $P I$. Current (amps A) = voltage difference (volts V) ÷ Resistance (ohms Ω) V . $I = V/R$. $V I R$. Conversions: Watts kW (divide by 1000-move decimal 3 places to the LEFT)

Ohm's Law & Power Practice Problems

Ohm's Law establishes a relationship between voltage and current through a linear resistance. In the tutorial defining and relating voltage, current, resistance, and power, we used water as an example. Thinking of that analogy, it probably isn't surprising that there is a mathematical relationship between how much water flows depending on the height of the head of water and the size of the pipe.
