Work truss problems efficiently. First look at the physics of the problem to see:

- if you can solve for the forces in any members by inspection.
- if you need to find the reactions.
- if there is symmetry in loading and geometry that can be used.

If the problem is not solved directly from the physics, then,

Statics is a branch in mechanics that studies the analysis of of loads on particles in static equilibrium. To put this in simple terms, statics is the study of forces on something that is not moving. The most helpful method to solving statics problems is making sure the sum of the forces equal zero.

Truss. The method of joints uses the summation of forces at a joint to solve the force in the members. It does not use the moment equilibrium equation to solve the problem. In a two dimensional set of equations, In three dimensions, $\sum F_x = 0$, $\sum F_y = 0$, $\sum F_z = 0$

As with any branch of physics, solving statics problems requires you to remember all sorts of calculations, diagrams, and formulas. The key to statics success, then, is keeping your shear and moment diagrams straight from your free-body diagrams and knowing the differences among the calculations for moments, centroids, vectors, and pressures.
